

This document is a short tutorial to run a Linux image with all ProbMetab dependencies using the free software VirtualBox.

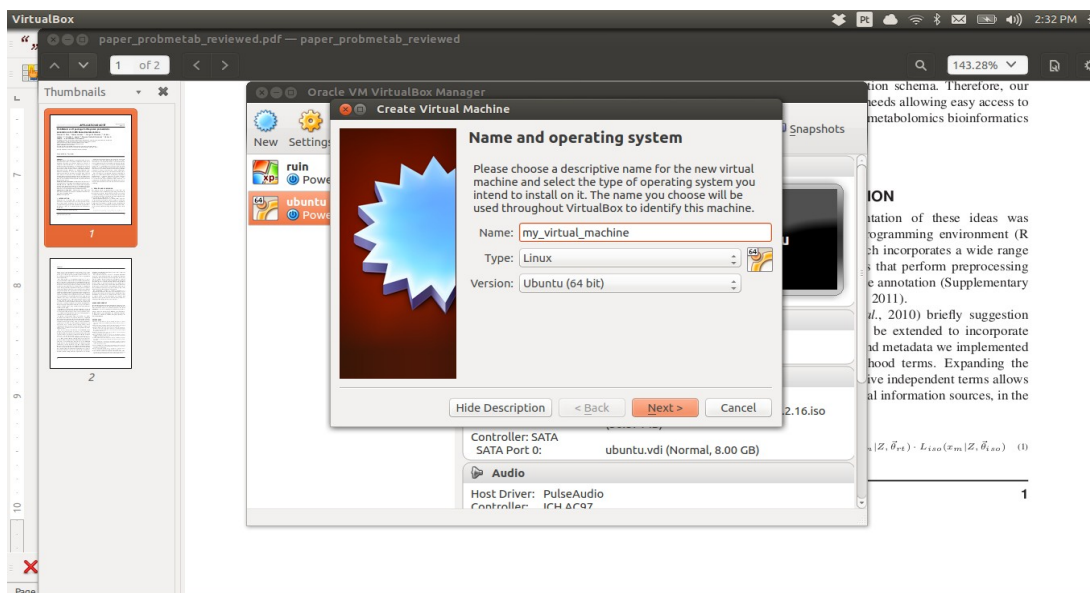

1°) The first step is downloading VirtualBox at:

<https://www.virtualbox.org/wiki/Downloads>

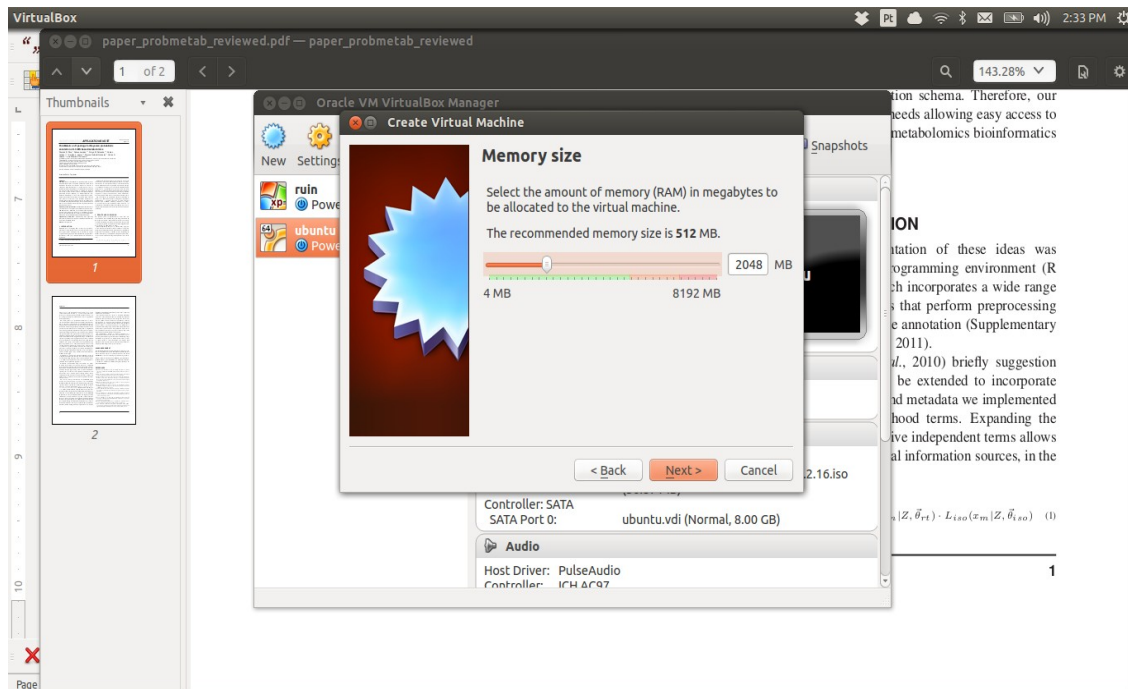

2°) Start a new virtual machine on VirtualBox on the up right blue button **New**:

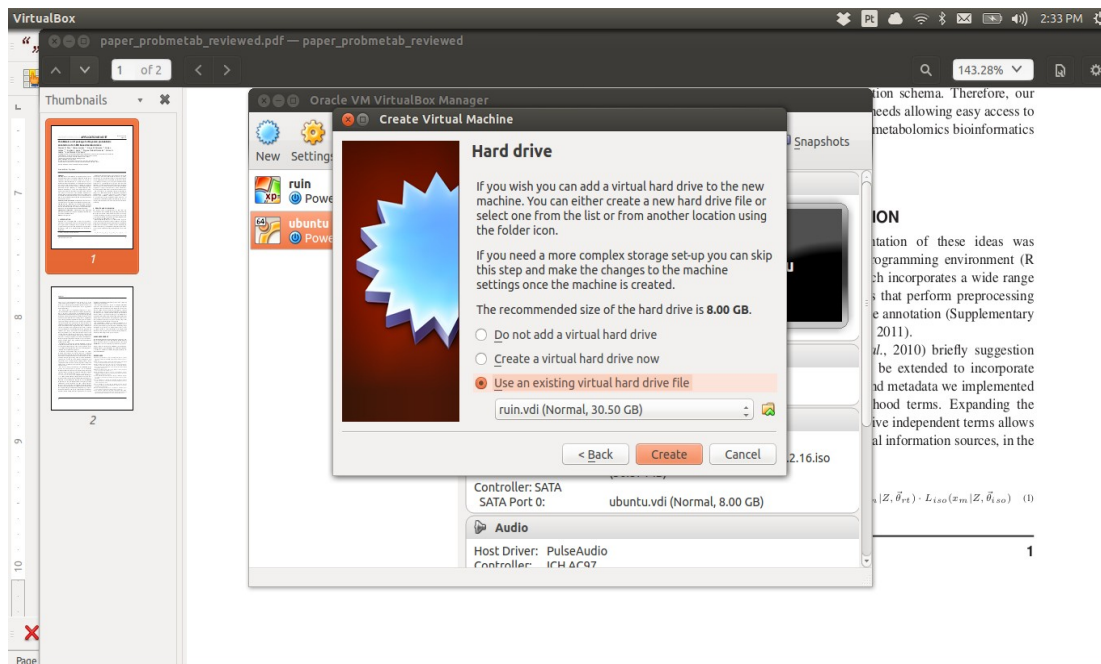

3°) Choose the **Type** Linux and **Version** ubuntu 64 bits, and click on **Next >** button:

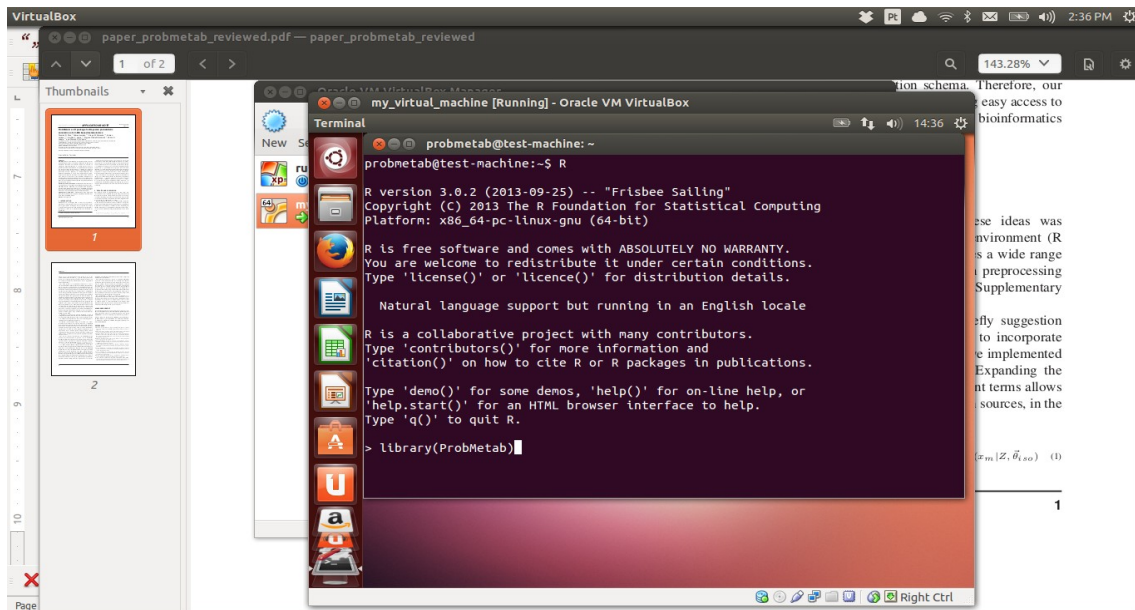

4°) Set a memory value on the bar and click on **Next >** button:

5°) Select the “Use an existing virtual hard drive file” option and Load the **ubuntu.vdi** file

6°) Double clicking the new created icon you should be able to run R and load ProbMetab with all its dependencies:

If necessary the system password is annotationprobmetab.
